Summary

Backend-focused engineer building reliable, low-latency systems and scalable APIs. Experience with event-driven architectures, data pipelines, and production RAG systems, with strong emphasis on correctness, observability, and performance under load.

Skills

- **Languages:** JavaScript, TypeScript, Python, SQL, C++
- **Backend:** Node.js, Fastify, NestJS, Express, REST APIs
- **Databases:** PostgreSQL, MongoDB, Redis, Redis Streams
- **Systems:** Caching, rate limiting, JWT auth, RBAC, queues, idempotency
- **Messaging & Realtime:** RabbitMQ, Pub/Sub, SSE

Work Experience

Full Stack Developer Intern

Sep 2025 – Jan 2026

Phyniks Dreamlabs LLP, Bangalore

- Built and optimized NestJS backends with validation layers, guards, caching, and efficient query patterns, improving API latency and stability.
- Developed SSR Next.js admin dashboards with fast initial load times and consistent server-side data fetching.
- Designed PostgreSQL and MongoDB schemas with indexing and access controls, enabling reliable multi-admin workflows.
- Introduced Redis caching, background jobs, and audit logging, reducing database load and improving system resilience.

Projects

SentinelRAG — Retrieval-Augmented Backend System — [Live] — [Repo]

Jan 2026

- Built a production RAG pipeline with hybrid retrieval (BM25 + embeddings) and LLM reranking for improved answer relevance.
- Established SLO-style latency bands: sub-1s retrieval/rerank and low-single-digit seconds end-to-end response time for typical queries.
- Designed document ingestion (parse → chunk → embed → index) handling 50–100 page PDFs in tens of seconds with stage-wise observability.
- Implemented caching, async workers, and structured logging for predictable performance and debuggability.

Invar — Distributed Metrics Ingestion Platform — [Live] — [Repo]

Dec 2025

- Built a high-throughput ingestion pipeline using Redis Streams with consumer groups and horizontal scaling.
- Designed hot-path (Pub/Sub) for real-time delivery and cold-path (PostgreSQL JSONB) for durable analytics.
- Implemented retry queues, DLQs, batching, and idempotent processing for correctness under failure scenarios.
- Delivered real-time dashboards via SSE with near real-time event propagation.

NexusFeed — Event-Driven Microservices Platform — [Live] — [Repo]

Nov 2025

- Architected a 6-service system with API Gateway, Identity, Posts, Media, and Search services.
- Implemented JWT auth with refresh rotation, rate limiting, and centralized request validation at the gateway.
- Designed RabbitMQ pipelines for async processing and eventual consistency across services.
- Built Docker-based deployment with service isolation, health checks, and internal communication.
- Optimized queries and caching layers to improve feed load performance and responsiveness.

Education

B.E. Computer Science & Software Engineering

2022 – 2026 (Expected)

Acharya Institute of Technology, Bengaluru
